

ABSTRACT

5 In order to more effectively use the constructional volume of a
volume screw machine of rotary type, a plurality of sets (80, 70; 60, 50)
of female elements having an inner screw surface and of male elements
having an outer screw surface is provided, wherein in each set a rotary
motion of at least one element is created. If the motion of elements in
10 different sets (80, 70; 60, 50) is synchronized, one can provide for a
dynamically balanced machine.
